A Qualitative Exploration of the Experience of Autism and Potential Clinical Applications

Why?

Autistic people seek and receive mental health services more frequently than those without autism, yet many mental professionals feel unprepared to work with autistic people. This goal of this research is to better inform therapists and other mental health professionals, and make mental health services better for autistic people. This study will gather stories and experiences of individuals who have been diagnosed with autism spectrum disorder.

You Might be a Great Participant if... What you'll be asked to do... • You are between the ages of 18-30 • Participants will complete a 60-90 minute interview regarding their life vears old • You were diagnosed with Autism experiences across developmental Spectrum Disorder at a young age periods: elementary school, junior (before 10 years old) high, and high school. • There will be a follow up between the • You are willing to discuss your experiences and perspectives on researcher and the participant to **Autism** ensure accuracy.
